### **Personal Profile**

I am working on web server projects 9+ years, as java or javascript (node.js) engineer. I have experience of working in local or remote teams, multicultural teams, using agile or waterfall.

Three major products that I worked on were [be2](#), [Workfront](#) and [VQuick](#) and my role in all cases was java engineer that was developing, maintaining and supporting backend part of web application and also doing some frontend work if that was required.

I developed few node.js modules shared on GitHub like [http-auth](#), [htpasswd](#), [htdigest](#) that are available via npm and are used by node.js community.

Additionally I developed one Android app shared on play store called [Birthday](#).

### **Work Experience**

#### **Freelancer - from 2016 to present**

Mostly working on short term projects with max 1 month duration. Usually I am targeting projects that require knowledge of javascript / java technologies. For javascript I prefer to use MEAN (MongoDB, ExpressJS, AngularJS, Node.js) stack and for java choice is Spring Framework with his modules. Also I do have some Open Source projects that I am actively contributing to like [FooFiles](#), [TypeItQuick](#).

#### **Java Engineer at VQuick - on 2015**

Developed web server application that is serving data to Android and iOS clients using technologies based on java enterprise standards for REST and Websocket protocols. I was responsible for driving small team of java/web developers, designing easy-to-scale architecture, developing it from scratch, setting up continuous integration tool, documenting API and covering with unit/integration tests important parts of it.

## Freelancer - from 2013 to 2015

Mostly was targeting small web projects with responsive layout and single page application design. One of projects I worked on was realtime return on investment calculator designed for beer sellers. Another provides storage solutions for users in USA with online checkout / order management. Also I developed few widgets for startup project [Informbots](#) and developed few video.js plugins for UK company [Lounge Logic](#).

## Java Engineer at AtTask / Workfront - from 2011 to 2013

Joined one of agile development teams called Galaxy. During that period I took a part in project that allowed to split application with monolithic architecture into several modules, to allow more flexibility during release process. Another responsibility was to improve API layer of application that was serving to web UI and mobile applications via REST/JSON. After company decided to move project from SVN to Git, I led migration part for local dev teams.

## Java Engineer at be2 - from 2007 to 2011

Started my work as part of development team responsible for developing payment module that was providing premium membership subscription functionality with many processes running in background like automatic renewal initiation, denied order collection/handling. Major goals of module were allowing product managers to create targeted product offers for each user depending on his data/activity and also have integration with many localized payment service providers to allow the most convenient way of checkout. After I joined one of agile development teams called Mojitos Amigos. In addition to payment module that I had chance to work on before I got chance to work on all areas of application, including big projects like designing base for unit/integration tests and also small user stories like improving love story writing functionality for users.

## Personal projects

<a href="#">http-auth</a>	node.js package for HTTP basic and digest access authentication.
<a href="#">FooFiles</a>	your very own personal file space on web.
<a href="#">TypeItQuick</a>	online typing contest.
<a href="#">flatback</a>	crossword solver for site <a href="#">www.scanword.ru</a> , based on helper site <a href="#">loopy.ru</a> .
<a href="#">Birthday</a>	android app for birthday notifications.

## Technical Expertise

<b>Java</b>	Spring Framework, Jersey, Apache Tomcat, JBoss, JUnit, Selenium, Mockito, JavaDoc, Android, Maven, Apache Ant
<b>JavaScript</b>	JavaScript, Node.js, npm, express, koajs, babeljs passportjs, socket.io, nodeunit, dox, Angular.js, Twitter Bootstrap, bower
<b>Databases</b>	MongoDB, MySQL
<b>Tools</b>	Jetbrains IDEA, Android Studio, Netbeans, WebStorm
<b>Dev Process</b>	Agile Development with Scrum, Waterfall
<b>CI</b>	Jenkins, Travis
<b>VCS</b>	Git, SVN
